

Head-of-line ($1_{\{n_1 \geq 1\}}$) vs full-rate (n_1) mechanisms at $\rho = 0.70$

Jockeying: $E[N_1]$ — head-of-line drains slower than full rate

Jockeying: $\pi_0 \equiv 1 - \rho$ for both (conservation of N)

Abandonment: $E[N_1]$ — head-of-line valve is weaker

Abandonment: $\pi_0 > 1 - \rho$ — full rate frees the server more
