

Model C₂ abandonment effect ($\rho = 0.70$): queues shrink, idle rises, throughput falls

$E[N_1] \downarrow 0$: abandonment is a self-regulating valve

$E[N_2]$ vs θ_1 (watch for non-monotonicity)

$\pi_0 > 1 - \rho$ whenever $\theta_1 > 0$ (Corollary C₂)

Throughput-quality tradeoff vs θ_1
