

# Traffic-intensity sweep ( $\mu = 1, \lambda_1 : \lambda_2 = 3 : 4$ ): A vs B<sub>2</sub> vs C<sub>2</sub>

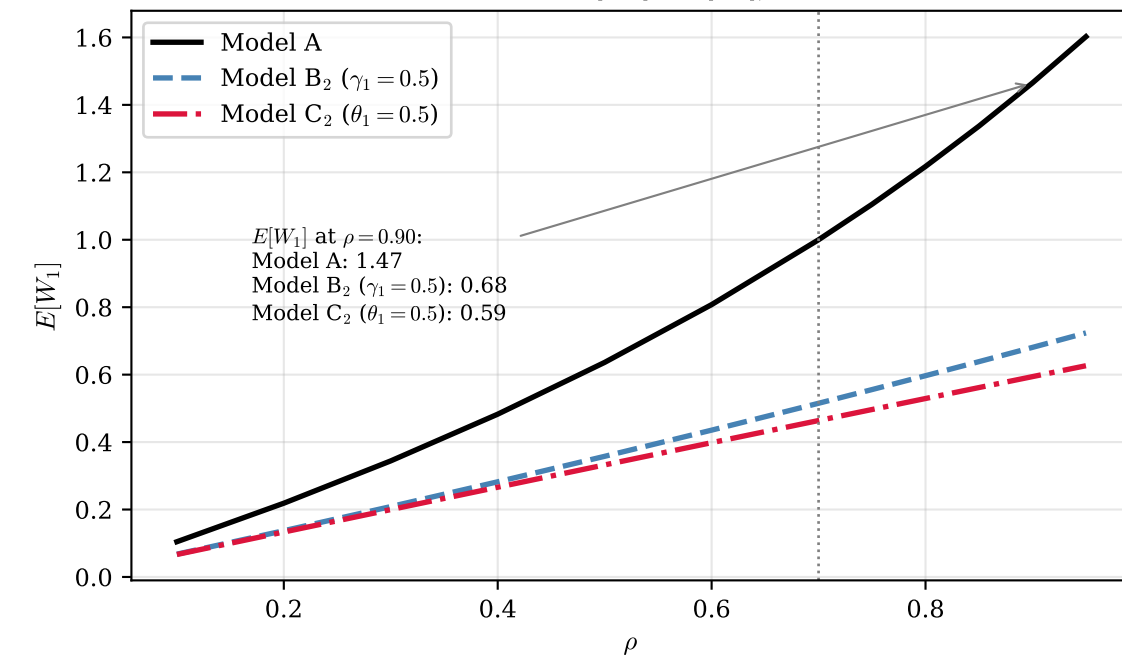

## Mean queue length $E[N]$ vs traffic intensity $\rho$

## Class-1 mean queue $E[N_1]$ vs $\rho$

## Priority waiting time $E[W_1] = E[N_1]/\lambda_1$ (Little's Law)

## Idle probability $\pi_0$ vs $\rho$
