

Convergence of the four specialisations to Model A ($\lambda_1 = 0.3$, $\lambda_2 = 0.4$, $\mu = 1$, $\rho = 0.70$)

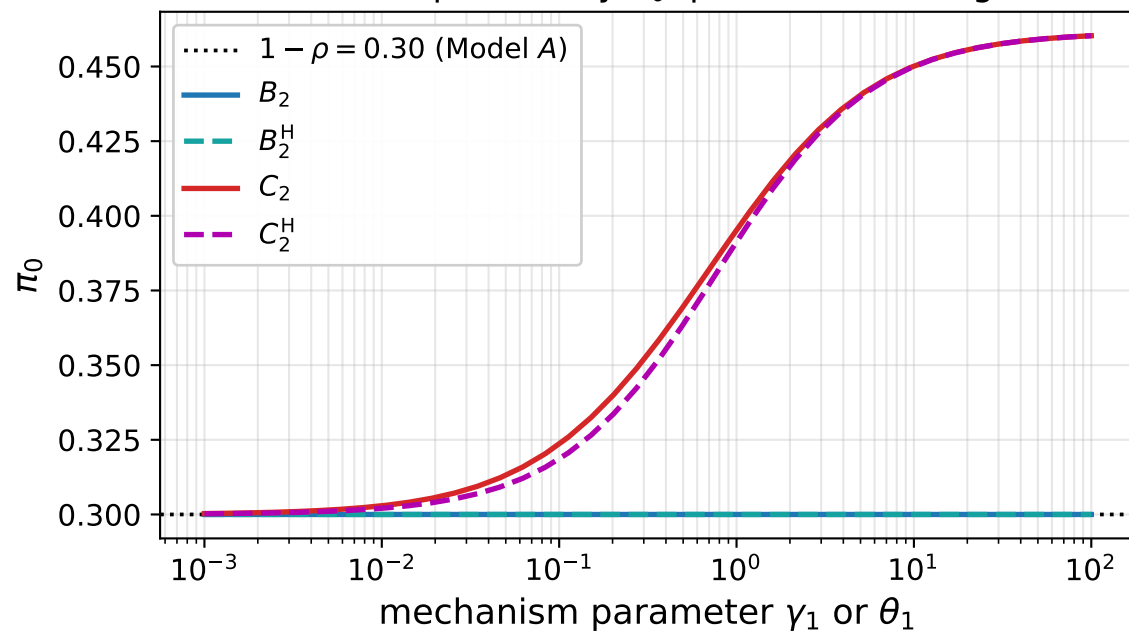

(a) L_1 convergence, log--log (order = slope)

(b) Same distances, linear axes (parameter ≤ 1)

(c) Idle probability π_0 : pinned vs drifting

(d) Busy-but-empty probability $\pi(0, 0)$
